

Deployment Verification - June 19, 2026

R1 Hybrid Floor + Trade Outcome Logging + Grade B tp_mult fix + Adaptive Pipeline

WHAT WAS DEPLOYED IN THIS PUSH

R1 Hybrid Floor (Scenario C)	Flat 15% below peak until equity reaches 2x start capital, then ratchet tightens to 10%
Grade B T1 tp_mult fix	Changed 4 locations: tp_mult 0.80 -> 1.00 (restores correct 1:2 R:R for Grade B T1 exits)
trade_outcomes table	31-field analytics table - logs every closed trade, never blocks engine
RSI debug print removed	Cleaned production logs (indicators.py)
adaptive_pipeline.py	Walk-forward validation engine - 10 coins, MINI_ASYM DAY_TRADE, monthly auto-run
routes_pipeline.py	Admin-only API: /pipeline/run, /status, /results, /report, /report/pdf, /history
Monthly scheduler	Auto-runs pipeline on 1st of each month; daily degradation check vs live trades
fpdf2 added to requirements	Enables PDF generation on Render server

CHECK 1 - trade_outcomes Table Population

Table created on Render	Confirmed - init_outcome_log_table() runs at server startup	PASS
31-field row validation	Pending - no closed trades yet since deployment	PENDING
Field match vs dashboard	Pending - re-run verify_deployment.py after next trade closes	PENDING

Re-run command (Render shell): VERIFY_EMAIL=mes29571@gmail.com python verify_deployment.py

Check 1 will auto-PASS once first trade closes and all 31 fields populate correctly.

CHECK 2 - Grade B T1 R:R = 2.0 Exactly

tp_mult fix deployed	4 locations changed from 0.80 to 1.00 in main.py	PASS
Live R:R confirmation	Pending - no Grade B T1 trade has closed since deployment	PENDING
Formula used by script	R:R = tp_pct / sl_pct (expects 2.00 +/- 0.05 tolerance)	INFO

ASYMMETRIC AI | Deployment Verification Report | 2026-06-19

Grade B T1 uses TP = 2 x SL distance. Before fix: tp_mult=0.80 compressed TP to 1.6x SL (broken).

After fix: tp_mult=1.00 -> TP = 2.0x SL (correct). Will auto-confirm on next Grade B T1 close.

CHECK 3 - Hard Floor Formula Confirmed [VERIFIED LIVE]

starting_capital	\$20.49
peak_equity	\$45.72 (2.23x starting capital)
2x threshold	\$40.98 -> RATCHET IS ACTIVE
Expected floor (ratchet)	max(\$20.49 x 0.85, \$45.72 x 0.90) = max(\$17.42, \$41.15) = \$41.15
DB floor_equity	\$41.15 -> EXACT MATCH

Ratchet formula	_compute_floor(peak, start_capital) -> max(start*0.85, peak*0.90) when peak >= 2x start	PASS
Ratchet activation	Real account crossed 2x threshold - ratchet is LIVE on actual trading account	PASS
Floor value in DB	\$41.15 vs expected \$41.15 - zero delta	PASS
Balance endpoint	Uses max(peak*0.85, stored_floor) - correct because stored_floor is already \$41.15	PASS

Scenario C (Hybrid 2x): protects profits aggressively once compounded gains are proven.
If equity pulls back to \$41.15, system stops. Current equity \$45.72 has \$4.57 breathing room.

CHECK 4 - Sentry New Errors Since Deployment [MANUAL STEP]

Sentry check	Cannot be automated - requires dashboard login. Instructions below.	PENDING
--------------	---	---------

- 1. Go to sentry.io and log in
- 2. Left sidebar: Projects -> select your Asymmetric AI / FastAPI project
- 3. Click 'Issues' in left menu
- 4. Set filter: First Seen = 2026-06-19 (today) | Sort by: First Seen
- 5. Scan for ANY of these specific new errors:
 - KeyError: 'start_capital' (runner init broke)
 - AttributeError on _compute_floor (floor function crashed)
 - TypeError in log_trade_outcome (wrong field types on trade close)

ASYMMETRIC AI | Deployment Verification Report | 2026-06-19

- IntegrityError on trade_outcomes INSERT (duplicate or schema mismatch)

- ImportError mentioning log_trade_outcome or init_outcome_log_table

- Any fpdf2 or adaptive_pipeline import error

6. If list is EMPTY or contains only pre-existing errors -> CHECK 4 PASS

7. If new error found -> paste title + traceback to Claude before continuing

DEPLOYMENT VERIFICATION SUMMARY

Check	Name	Status	Notes
Check 1	trade_outcomes rows	PENDING	Re-run after next closed trade
Check 2	Grade B T1 R:R = 2.0	PENDING	Re-run after next Grade B T1 close
Check 3	Hard floor = Hybrid formula	PASS	VERIFIED LIVE: floor \$41.15, ratchet active
Check 4	Sentry - no new errors	PENDING	Manual: check sentry.io -> Issues, First Seen today

NEXT STEPS:

1. Check Sentry now (Check 4) - if clean, deployment is safe to trust
2. Checks 1 and 2 resolve automatically after next trade closes
3. After all 4 checks confirmed: run adaptive pipeline Phase 1
Render shell: `python3 -c "from adaptive_pipeline import start_pipeline; print(start_pipeline('manual'))"`
4. Pipeline sends Telegram notification when complete (~15-30 min for 10 coins)
5. Download Phase 1 PDF from: `/pipeline/report/{run_id}/pdf`

REFERENCE - R1 Hybrid Floor Formula (Scenario C)

```
def _compute_floor(peak, start_capital):  
    if start_capital > 0 and peak >= 2.0 * start_capital:  
        return round(max(start_capital * 0.85, peak * 0.90), 2)    # Ratchet: tighten to 10% from peak  
    return round(peak * 0.85, 2)                                # Flat: 15% from peak (proving phase)
```

Scenario A (Flat 15%): floor = peak x 0.85 always - simple, never tightens

Scenario B (Ratchet only): floor = max(start x 0.85, peak x 0.90) always - aggressive from day 1

Scenario C (Hybrid 2x): Scenario A until 2x growth, then Scenario B - CHOSEN (deployed)

Why Scenario C: flat floor while proving edge on small account; ratchet kicks in only after doubling capital, locking in compounded gains without over-tightening early volatile runs.
